## **Big Idea Summary**

### **Big Idea 1: Evolution (EVO)**

**Description: The process of evolution drives the diversity and unity of life.**

Evolution is a change in the genetic makeup of a population over time, with natural selection as its major driving mechanism. Darwin's theory, which is supported by evidence from many scientific disciplines, states that inheritable variations occur in individuals in a population. Due to competition for limited resources, individuals with more favorable genetic variations are more likely to survive and produce more offspring, thus passing traits to future generations. A diverse gene pool is vital for the survival of species because environmental conditions change. The process of evolution explains the diversity and unity of life, but an explanation about the *origin* of life is less clear.

In addition to the process of natural selection, naturally occurring catastrophic and human-induced events, as well as random environmental changes can result in alteration in the gene pools of populations. Scientific evidence supports that speciation and extinction have occurred throughout Earth's history and that life continues to evolve within a changing environment, thus explaining the diversity of life.

### **Big Idea 2: Energetics (ENE)**

**Description: Biological systems use energy and molecular building blocks to grow, to reproduce, and to maintain dynamic homeostasis.**

Cells and organisms must exchange matter with the environment. Organisms respond to changes in their environment at the molecular, cellular, physiological, and behavioral levels. Living systems require energy and matter to maintain order, to grow, and to reproduce. Organisms employ various strategies to capture, use, and store energy and other vital resources. Energy deficiencies are not only detrimental to individual organisms; they also can cause disruptions at the population and ecosystem levels. Homeostatic mechanisms that are conserved or divergent across related organisms reflect either continuity due to common ancestry or evolutionary change in response to distinct selective pressures.

### **Big Idea 3: Information Storage and Transmission (5 EUs)-IST**

**Description: Living systems store, retrieve, transmit, and respond to information essential to life processes.**

Genetic information provides for continuity of life and, in most cases, this information is passed from parent to offspring via DNA. Nonheritable information transmission influences behavior within and between cells, organisms, and populations. These behaviors are directed by underlying genetic information, and responses to information are vital to natural selection and evolution. Genetic information is a repository of instructions necessary for the survival, growth, and reproduction of the organism. Genetic variation can be advantageous for the long-term survival and evolution of a species.

### **Big Idea 4: Systems Interactions (3 EUs)-SYI**

**Description: Biological systems interact, and these systems and their interactions exhibit complex properties.**

All biological systems comprise parts that interact with one another. These interactions result in characteristics and emergent properties not found in the individual parts alone. All biological systems from the molecular level to the ecosystem level exhibit properties of biocomplexity and diversity. These two properties provide robustness to biological systems, enabling greater resiliency and flexibility to tolerate and respond to changes in the environment.

College Board AP® Biology Curriculum Framework**

<b>Unit 1: Chemistry of Life (6 Topics) AP® Biology Curriculum Framework</b>		
<b>Big Ideas</b>	<b>Enduring Understandings</b>	<b>Campbell Biology, 12<sup>th</sup> Edition, AP® Edition Chapters and Key Concepts</b>
<b>Energetics (ENE)</b>	ENE-1: The highly complex organization of living systems requires constant input of energy and the exchange of macromolecules.	Chapter 8, An Introduction to Metabolism 143-163 Chapter 9, Cellular Respiration and Fermentation, 164-186 Chapter 10, Photosynthesis, 187-211  Background Chapter 5 The Structure and Function of Large Biological Molecules 66-91 Key Concept 5.1, Molecules of Life, 67-68 Key Concept 5.2, Carbohydrates serve as fuel and building material, 68-72 Key Concept 5.3, Lipids are a diverse group of hydrophobic molecules, 72-75 Key Concept 5.4, Proteins include a diversity of structures, resulting in a wide range of functions, 75-83
<b>Information Storage and Transmission (IST)</b>	IST-1: Heritable information provides for continuity of life.	Chapters 15, The Chromosomal Basis of Inheritance, 294-313 Chapter 16, The Molecular Basis of Inheritance, 314-334 Chapter 17, Gene Expression: From Gene to Protein, 335-364
<b>Systems Interactions (SYI)</b>	SYI-1: Living systems are organized in a hierarchy of structural levels that interact.	Chapter 40, Basic Principles of Animal Form and Function 873-897 Key Concept 40.1, Animal form and function are correlated at all levels of organization, 874-881 Key Concept 40.2, Feedback control maintains the internal environment in many animals, 881-883 Key Concept 40.3, Homeostatic processes for thermoregulation involve form, function, and behavior, 884-889

College Board AP® Biology Curriculum Framework**

<b>Unit 2: Cell Structure and Function (11 Topics) AP® Biology Curriculum Framework</b>		
<b>Big Ideas</b>	<b>Enduring Understandings</b>	<b>Campbell Biology, 12<sup>th</sup> Edition, AP® Edition Chapters and Key Concepts</b>
<b>Evolution (EVO)</b>	EVO-1: Evolution is characterized by a change in the genetic makeup of a population over time and is supported by multiple lines of evidence.	<p>Chapter 22, Descent with Modification: A Darwinian View of Life, 468-485 Key Concept 22.3, Evolution is supported by an overwhelming amount of scientific evidence, 476-484</p> <p>Chapter 23, The Evolution of Populations, 486-505 Key Concept 23.1, Genetic variation makes evolution possible, 487-489 Key Concept 23.2, The Hardy-Weinberg equation can be used to test whether a population is evolving, 489-493 Key Concept 23.3, Natural selection, genetic drift, and gene flow can alter allele frequencies in a population, 493-497</p>
<b>Energetics (ENE)</b>	ENE-1: The highly complex organization of living systems requires constant input of energy and the exchange of macromolecules.	<p>Chapter 8, An Introduction to Metabolism, 143-163 Key Concept 8.1, An organism's metabolism transforms matter and energy, subject to the laws of thermodynamics, 144-147 Key Concept 8.2, The free-energy change of a reaction tells us whether or not the reaction occurs spontaneously, 147-150 Key Concept 8.3, ATP powers cellular work by coupling exergonic reactions to endergonic reactions, 150-153 Key Concept 8.4, Enzymes speed up metabolic reactions by lowering energy barriers, 153-159 Key Concept 8.5, Regulation of enzyme activity helps control metabolism, 159-161 Chapter 9, Cellular Respiration and Fermentation, 164-186 Chapter 10, Photosynthesis, 187-211</p>

**A Correlation of Campbell Biology 12th Edition, AP<sup>®</sup> Edition ©2021 (Key Concepts)  
to the  
College Board AP<sup>®</sup> Biology Curriculum Framework**

	<p>ENE-2: Cells have membranes that allow them to establish and maintain internal environments that are different from their external environments.</p>	<p>Chapter 7, Membrane Structure and Function, 126-142            Key Concept 7.1, Cellular membranes are fluid mosaics of lipids and proteins 127-131            Key Concept 7.2, Membrane structure results in selective permeability, 131-132            Key Concept 7.3, Passive transport is diffusion of a substance across a membrane with no energy investment, 132-136            Key Concept 7.4, Active Transport uses energy to move solutes against their gradients, 136-139            Key Concept 7.5, Bulk transport across the plasma membrane occurs by exocytosis and endocytosis, 139-141</p>
<p><b>Systems Interactions (SYI)</b></p>	<p>SYI-1: Living systems are organized in a hierarchy of structural levels that interact.</p>	<p>Chapter 40, Basic Principles of Animal Form and Function 873-897            Key Concept 40.1, Animal form and function are correlated at all levels of organization, 874-881            Key Concept 40.2, Feedback control maintains the internal environment in many animals, 881-883            Key Concept 40.3, Homeostatic processes for thermoregulation involve form, function, and behavior, 884-889</p>
